

Energy Matters Airbreeze wind turbine stop switch

Southwest Windpower recommends the use of a stop switch to provide a convenient method for shutting down the Air Breeze turbine. A switch is supplied with each Marine Breeze as standard equipment and is available from Energy Matters for the Land Breeze.

The switch first disconnects the battery and then shorts the turbine output wires together causing the turbine to stop spinning (in high winds the blades may spin slowly). Shorting the turbine does not cause any damage or additional wear.
